

Here's what others say about Eagle Bellows Seal Valves

An unsolicited testimonial -
reprinted from OXY NEWS, a monthly publication of Occidental Chemical Company for their Florida Operation employees.

Less Steam Loss Means More Dollars

Attacking one of the biggest problems of the trade, steam loss, Larry Peiper and his Energy Conservation group along with the cooperative efforts of the chemical plant employees, have realized a remarkable improvement with this problem through the use of a new steam valve.

Steam loss in 1980 resulted in an additional expense of approximately \$200,000, but as of June of this year, an improvement has been made that will amount to an annual savings of approximately \$110,000.

Through a concerted effort of the maintenance departments at both plants, everyone has been keeping an eye out for new, improved products they can use in the battle against energy waste. George Glover, Suwannee River Chemical Maintenance, and Dorsey Moors, Swift Creek Chemical, began using a new valve called the eagle bellow seal steam valve with zero steam leakage and zero maintenance.

"The valve is expensive," Peiper said, "but, oh so effective. The savings far outweigh the cost involved."

Experience to date shows no steam leaks from the stem packing and no maintenance problems.

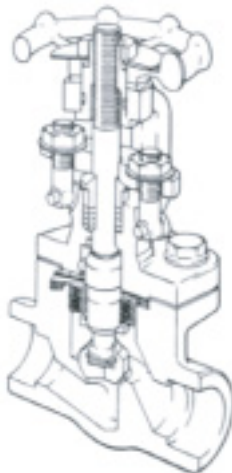

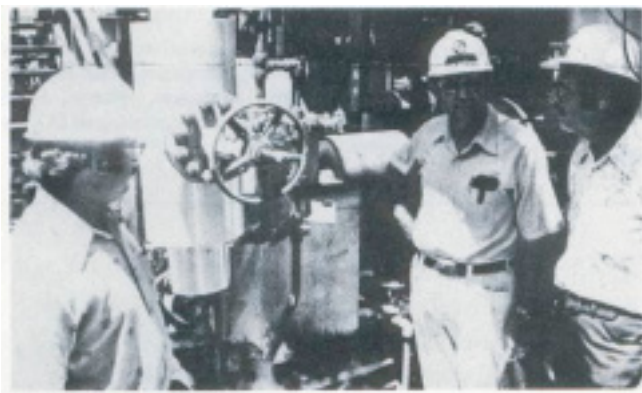

Diagram of valve – the non rotating stem mechanism is designed to prevent torsional loads on the bellows assembly. Secondary seal provides back-up protection. Welded bellows provide superior cycle life and better performance because stress is evenly distributed throughout the bellows plates. Standard bellows material is a special nickel alloy, permitting the valve to be used in the widest possible range of fluids and gases.

EAGLE VALVES

SAVE YOU MONEY

How? By totally eliminating steam loss due to valve stem leakage ... and by ending continual packing adjustment and replacement.
